# The Rank of a Matrix

## Definition

Let  $A \in M_{m \times n}(F)$ . The **rank** of  $A$ , denoted  $\text{rank}(A)$  is defined to be the rank of the linear transformation  $L_A : F^n \rightarrow F^m$ .

# How to Compute the Rank of a Matrix?

## Theorem

Let  $A$  be an  $m \times n$  matrix of rank  $r$ . Then  $r \leq n$  and  $r \leq m$ , and, by means of a finite number of elementary row and columns operations,  $A$  can be transformed into the matrix

$$D = \begin{pmatrix} I_r & 0_1 \\ 0_2 & 0_3 \end{pmatrix},$$

where  $0_1, 0_2$ , and  $0_3$  are zero matrices.

## Corollary

*Let  $A$  be an  $m \times n$  matrix of rank  $r$ . Then there exist invertible matrices  $B$  and  $C$  of sizes  $m \times m$  and  $n \times n$ , respectively, such that  $D = BAC$ , where*

$$D = \begin{pmatrix} I_r & 0_1 \\ 0_2 & 0_3 \end{pmatrix}.$$

## Corollary

*Let  $A$  be an  $m \times n$  matrix. Then*

## Corollary

Let  $A$  be an  $m \times n$  matrix. Then

①  $\text{rank}(A^t) = \text{rank}(A)$ .

## Corollary

Let  $A$  be an  $m \times n$  matrix. Then

- 1  $\text{rank}(A^t) = \text{rank}(A)$ .
- 2 *The rank of any matrix equals the maximum number of its linearly independent rows.*

## Corollary

Let  $A$  be an  $m \times n$  matrix. Then

- 1  $\text{rank}(A^t) = \text{rank}(A)$ .
- 2 The rank of any matrix equals the maximum number of its linearly independent rows.
- 3 The rows and columns of any matrix generate subspaces of the same dimension, equal to the rank of the matrix.

## Corollary

*Every invertible matrix is a product of elementary matrices.*

## Theorem

Let  $T : V \rightarrow W$  and  $U : W \rightarrow Z$  be linear transformations on finite-dimensional vector spaces  $V, W$ , and  $Z$ , and let  $A$  and  $B$  be matrices such that the product  $AB$  is defined. Then

- 1  $\text{rank}(UT) \leq \text{rank}(U)$ .
- 2  $\text{rank}(UT) \leq \text{rank}(T)$ .
- 3  $\text{rank}(AB) \leq \text{rank}(A)$ .
- 4  $\text{rank}(AB) \leq \text{rank}(B)$ .
