This is a test file. We start by scaling the figure to the width of the page. Note that for visibility, we have enclosed the postscript figure using a framed box (\fbox or \framebox) instead of a regular box (\hbox, \mbox, or \makebox).
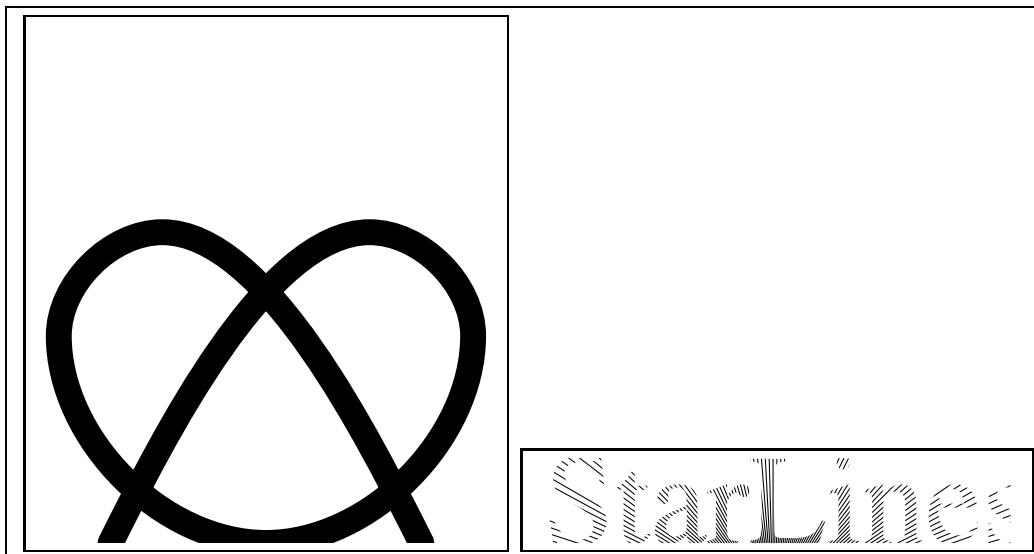

Naturally, we can scale the figure to any size

or using oldstyle commands like \psfig:

or even as a special character to appear in line ✿ .

This figures can be arranged in the usual TeX ways:

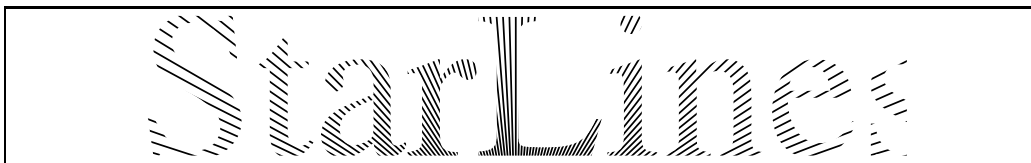

On the left,

On the right,

They can be centered as well

You can adjust both the height and width of the box:

Finally, we can balance two boxes of different heights:
