- ▶ **Matlab**

Concepts from reading

Ordinary differential equations

Math 23, Spring
2007

Scott Pauls

[Administrivia](#)

[Today's material](#)

[Next class](#)

Definition

An ordinary differential equation (ODE) is simply an equation that includes a function f and one or more of its derivatives.

Example

$$\frac{df}{dt} = \sin(t)$$

Example

$$\frac{df}{dt} = f(t)$$

Concepts from reading

Ordinary differential equations

Today's material

Next class

- ▶ Physical laws: $F = ma$
- ▶ Exponential growth and decay: *the rate of change in the amount of material is proportional to the current amount of material*
- ▶ Predator-Prey dynamics:
 - ▶ Growth assumption
 - ▶ Predation assumption: *e.g. each predator kills x prey each day*
 - ▶ Generalizations: model predator population, add natural death, etc.

Direction fields

Math 23, Spring
2007

Scott Pauls

Administrivia

Today's material

Next class

A direction field is a way to visualize certain ODE and to qualitatively examine its solutions.

$$\frac{dy}{dt} = f(t, y)$$

- ▶ At each point (y_0, t_0) , draw a vector with slope $f(t, y)$.
- ▶ Solutions to the ODE can be seen in the field plot.
- ▶ <http://math.rice.edu/~dfield>

Concepts from reading
