Laplace's equation

$$f_{xx} + f_{yy} = 0$$

Guess: $f(x, y) = X(x)Y(y)$

$$\frac{X''(x)}{X(x)} = \frac{Y''(y)}{Y(y)} = \lambda$$

Reorganizing this gives:

$$X'' - \lambda X = 0, \quad Y'' + \lambda Y = 0$$

For different values of λ , these equations have general solutions that look like either

$$C_1 \cos(\sqrt{|\lambda|}t) + C_2 \sin(\sqrt{|\lambda|}t)$$

or

$$C_1 \cosh(\sqrt{|\lambda|}t) + C_2 \sinh(\sqrt{|\lambda|}t)$$

To form the most general solution, via the principle of superposition, we would take sums of these solutions over all eigenvalues λ yielding, for examples, infinite sums of sin and cos terms:

$$\frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos\left(\frac{n\pi x}{L}\right) + b_n \sin\left(\frac{n\pi x}{L}\right)$$

Such a series is called a **Fourier series**. At points where it converges, it gives a function f . In this case, the series is called the Fourier series of f .

Fourier series

Some observations:

- ▶ Fourier series are periodic
- ▶ sin and cos functions are independent (also called **orthogonal**)) in the following sense:

$$\int_{-L}^L \cos\left(\frac{n\pi x}{L}\right) \sin\left(\frac{m\pi x}{L}\right) dx = 0$$

$$\int_{-L}^L \cos\left(\frac{n\pi x}{L}\right) \cos\left(\frac{m\pi x}{L}\right) dx = 0 \text{ if } m \neq n$$

If $m = n$, the integral equals L .

$$\int_{-L}^L \sin\left(\frac{n\pi x}{L}\right) \sin\left(\frac{m\pi x}{L}\right) dx = 0 \text{ if } m \neq n$$

If $m = n$, the integral equals L .

Assume for a moment that we have a convergent Fourier series:

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos\left(\frac{n\pi x}{L}\right) + b_n \sin\left(\frac{n\pi x}{L}\right)$$

What are the coefficients $\{a_n, b_n\}$?

$$a_n = \frac{1}{L} \int_{-L}^L f(x) \cos\left(\frac{n\pi x}{L}\right) dx$$

$$b_n = \frac{1}{L} \int_{-L}^L f(x) \sin\left(\frac{n\pi x}{L}\right) dx$$

Theorem

Suppose f and f' are piecewise continuous on the interval $-L \leq x < L$. Further suppose that f is defined outside this interval and is periodic with period $2L$. Then f has a Fourier series whose coefficients are given by our formulas above. The Fourier series converges to $f(x)$ at all points where f is continuous and to $(f(x+) + f(x-))/2$ at all points of discontinuity.
